## Getting Started

To get started, visit Tinkercad's website and create an account or log into an existing one. Then select "Circuits" on the left side of the screen:

After logging in to Tinkercad, click on "Circuits" on the left-hand side. Select "Create new Circuit" on the next page and you'll be greeted with the following screen:

The "Create New Circuit" homepage in Tinkercad.

The camera can be moved by holding down any mouse button and moving your mouse without hovering a part.

To familiarize yourself with the circuit design homepage, let's go over the areas I've marked with numbers:

1. Change the name of your design here

2. This is the main toolbar. From the left to the right: Rotate the selected part clockwise, delete the selected part, undo and redo your last action(s), create annotations and toggle their visibility.

3. This is where you do the block coding

4. Start the simulation

5. Export your design to Autodesk EAGLE.

6. Choose the parts to display in the list below. I recommend choosing "All".

7. These are the parts you can use.

8. The main work area. Drag and drop parts here to add them to your design.

9. Fit everything into the view.
